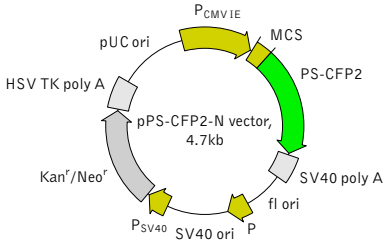
pPS-CFP2-N vector

The vector sequence has been compiled using the information from sequence databases, published literature, and other sources, together with partial sequences obtained by Evrogen. This vector has not been completely sequenced.

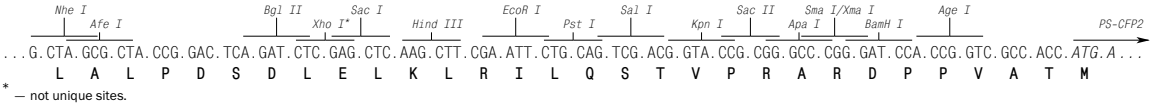


For vector sequence, please visit our Web site at http://www.evrogen.com/products/vectors.shtml

Product	Cat.#	Size
pPS-CFP2-N vector	**FP802**	20 μg

Vector type	mammalian expression vector
Reporter	PS-CFP2
Reporter codon usage	mammalian
Promoter for PS-CFP2	$P_{CMV\ IE}$
Host cells	mammalian
Selection	prokaryotic - kanamycin eukaryotic - neomycin (G418)
Replication	prokaryotic - pUC ori eukaryotic - SV40 ori
Use	PS-CFP2 expression in mammalian cells; generation of fusions to the PS-CFP2 N-terminus

Multiple cloning site (MCS)



* — not unique sites.

Location of features

$P_{CMV\ IE}$: 1-589
Enhancer region: 59-465
TATA box: 554-560
Transcription start point: 583
MCS: 591-671
PS-CFP2
Kozak consensus translation initiation site: 672-682
Start codon (ATG): 679-681; Stop codon: 1393-1395
SV40 early mRNA polyadenylation signal
Polyadenylation signals: 1549-1554 & 1578-1583
mRNA 3' ends: 1587 & 1599
f1 single-strand DNA origin: 1646-2101
Eukaryotic promoter for expression of Kan^r gene
-35 region: 2163-2168; -10 region: 2186-2191
Transcription start point: 2198
SV40 origin of replication: 2442-2577
SV40 early promoter
Enhancer (72-bp tandem repeats): 2275-2346 & 2347-2418
21-bp repeats: 2422-2442, 2443-2463 & 2465-2485
Early promoter element: 2498-2504
Major transcription start points: 2494, 2532, 2538 & 2543
Kanamycin/neomycin resistance gene
Neomycin phosphotransferase coding sequences:
Start codon (ATG): 2626-2628; Stop codon: 3418-3420
G->A mutation to remove Pst I site: 2808
C->A (Arg to Ser) mutation to remove BssH II site: 3154
Herpes simplex virus (HSV) thymidine kinase (TK) polyadenylation signal
Polyadenylation signals: 3656-3661 & 3669-3674
pUC plasmid replication origin: 4005-4648

Vector description

pPS-CFP2-N is a mammalian expression vector encoding cyan-to-green photoswitchable fluorescent protein PS-CFP2. The vector allows generation of fusions to the PS-CFP2 N-terminus and expression of PS-CFP2 fusions or PS-CFP2 alone in eukaryotic (mammalian) cells.
PS-CFP2 codon usage is optimized for high expression in mammalian cells (humanized) [Haas et al. 1996]. To increase mRNA translation efficiency, Kozak consensus translation initiation site is generated upstream of the PS-CFP2 coding sequence [Kozak 1987]. Multiple cloning site (MCS) is located between $P_{CMV\ IE}$ and PS-CFP2 coding sequence.

The vector backbone contains immediate early promoter of cytomegalovirus ($P_{CMV\ IE}$) for protein expression, SV40 origin for replication in mammalian cells expressing SV40 T-antigen, pUC origin of replication for propagation in *E. coli*, and f1 origin for single-stranded DNA production. SV40 polyadenylation signals (SV40 poly A) direct proper processing of the 3'-end of the reporter mRNA.

SV40 early promoter (P_{SV40}) provides neomycin resistance gene (Neo^r) expression to select stably transfected eukaryotic cells using G418. Bacterial promoter (P) provides kanamycin resistance gene expression (Kan^r) in *E. coli*. Kan^r/Neo^r gene is linked with herpes simplex virus (HSV) thymidine kinase (TK) polyadenylation signals.

Generation of PS-CFP2 fusion proteins

A localization signal or a gene of interest can be cloned into MCS of the vector. It will be expressed as a fusion to the PS-CFP2 N-terminus when inserted in the same reading frame as PS-CFP2 and no in-frame stop codons are present. The inserted sequence should contain an initiating ATG codon. PS-CFP2-tagged fusions retain fluorescent properties of the native protein allowing fusion localization *in vivo*. Unmodified vector will express PS-CFP2 when transfected into eukaryotic (mammalian) cells.

Note: The plasmid DNA was isolated from dam$^+$-methylated *E.coli*. Therefore some restriction sites are blocked by methylation. If you wish to digest the vector using such sites you will need to transform the vector into a dam$^-$ host and make fresh DNA.

Expression in mammalian cells

pPS-CFP2-N vector can be transfected into mammalian cells by any known transfection method. CMV promoter provides strong, constitutive expression of PS-CFP2 or its fusions in eukaryotic cells. If required, stable transformants can be selected using G418 [Gorman 1985].

Propagation in *E. coli*

Suitable host strains for propagation in *E. coli* include DH5alpha, HB101, XL1-Blue, and other general purpose strains. Plasmid incompatibility group is pMB1/ColE1. The vector confers resistance to kanamycin (30 μg/ml) to *E. coli* hosts. Copy number in *E. coli* is about 500.
